Heat flow estimates at two sites on the U.S. Atlantic continental margin are presented. An estimate of the heat flowing from the basement also has been obtained. About 4.8 km of sediments penetrated at the COST B-2 and 4.0 km at the COST B-3 were deposited since the Upper Jurassic. Well logs were used to evaluate thermal gradients and sedimentation rates, whereas thermal conductivities and radiogenic heat productions were measured on drill cuttings samples. A procedure to estimate in-situ thermal conductivity from drill cuttings and well logs is described. A substantial set of samples, in the form of drill cuttings, were sorted in four major lithologies: sandstones, siltstones, shales and limestones. Laboratory measurements of density, porosity, thermal conductivity, quartz (%), potassium (%), uranium (ppm) and thorium (ppm) were performed on 128 reorganized and pulverized samples. A significant correlation of the matrix thermal conductivity to quartz and potassium content was found. In situ porosity and volume fraction of

each lithology, determined mainly from well logs, were used to calculate in situ mean thermal conductivity. Finally the mean in situ vertical component of the thermal conductivity, as required for heat flow values, has been estimated from a correction factor for the anisotropy of each lithology. The in-situ temperature and anisotropy effects substantially decrease estimates of thermal conductivity at depth. Below the uppermost 1 km in both wells the best estimate of the thermal gradient is  $26.3^{\circ}\text{C km}^{-1}$  at COST B-2 and  $26.1^{\circ}\text{C km}^{-1}$  at COST B-3, whereas in situ mean thermal conductivities range between about  $1.8$  and  $1.9 \text{ W m}^{-1} \text{ K}^{-1}$  ( $4.3$ - $4.5$  T.C.U.). The average heat flow is estimated as about  $45 \text{ mWm}^{-2}$  ( $1.07$  H.F.U.) at COST B-2 and  $44 \text{ mWm}^{-2}$  ( $1.06$  H.F.U.) at COST B-3, with an uncertainty of about 20-25%. The mean radiogenic production in sediments at the two sites has been estimated as  $1.83$  (COST B-2) and  $1.44$  (COST B-3)  $10^{-6} \text{ Wm}^{-3}$ . With a 12-14 km thick sedimentary sequence a radioactive contribution of 20-25  $\text{mWm}^{-2}$  can be expected. The effects of sediment deposition, compaction, pore water advection and radiogenic heat production have been combined in a numerical model (Hutchison, 1985) to estimate the undisturbed basement heat flux. Although the sedimentation depresses the basement heat flux by 15-20%, this effect is more than compensated by radioactive heat production in the sediments, so that the surface flux is estimated to be higher than that from the basement. The latter is calculated at about  $33$ - $39 \text{ mWm}^{-2}$  ( $0.8$ - $0.9$  H.F.U.), a relatively low value. The overall uncertainty is about  $\pm 20$ - $25\%$ , and other estimates on continental margins with thick sediments (e.g. Reiter and Jessop, 1985) probably have at least a similar

uncertainty.

entomopathogens, including entomophthorales, entomopathogenic fungi, entomopathogenic bacteria of the Bacilli, Nematode parasites, and pathogens and parasites of terrestrial molluscs. The book presents the perspectives of an international group of experts in the fields of invertebrate pathology, including microbiology, mycology, virology, nematology, biological control, and integrated pest management. Organized into 15 chapters, the book covers methods for the study of virtually every major group of entomopathogen, as well as methods for discovery and diagnosis of entomopathogens and the use of complementary methods for microscopy. It discusses the use of molecular techniques for identifying and determining phylogeny, factors that contribute to resistance to entomopathogens, and several other aspects of the science of invertebrate pathology. It also explains initial handling and diagnosis of diseased invertebrates, basic techniques in insect virology, and bioassay of bacterial entomopathogens against insect larvae. In addition, the reader is introduced to the use of bacteria against soil-inhabiting insects and preservation of entomopathogenic fungal cultures. The remaining chapters focus on research methods for entomopathogenic microsporidia and other protists, how the pathogenicity and infectivity of entomopathogens to mammals are tested, and preparations of entomopathogens and diseased specimens for more detailed study using microscopy. Experienced insect pathologists, biologists, entomologists, students, biotechnology personnel, technicians, those working in the biopesticide industry, and government regulators will find this manual extremely helpful. Step-by-step instructions for the latest

Diving, scientific diving, and diver safety are specialized subject areas not generally well-represented in even the largest of academic libraries, largely because of difficulties in locating appropriate items to include in the collection. However, in order to adequately fulfill his/her responsibilities, the Diving Safety Officer of a scientific diving program needs easy access to a broad range of books, reports, and journals covering all aspects of diving. This bibliography outlines a comprehensive collection appropriate to the needs of a scientific diving program in a research or academic institution. Items are grouped in broad subject areas

relationship meant in the past? How is it changing, and what relevance might it have for the future? Combining sound scholarship with an engaging style, their fascinating and often humorous accounts reveal the vital connection between rural people and wildlife: between the Bornean farmer and the yellow wagtail, without whose arrival rice goes unplanted; between the wife in Papua New Guinea and her pigs, whose breeding rate determines when she gets a break from housework and when her husband goes to war; between the guards in Java's Ujung Kulon National Park and the rhinoceros, whose urine they collect as a cure for earaches. The authors identify four major ecocultural revolutions that have significantly altered the relationship between people and nature. They suggest that a fifth revolution, characterized by respect and understanding of the traditional knowledge and insight reflected in myth and memory, will enable modern society to develop nature conservation programs with a chance of lasting success.
