This book is for every teacher or trainer-- whose computer skills may be limited-- who wants to understand the Internet educationally, and use it in his or her courses. As institutional pressures mount to integrate the Internet into teaching, this book provides a framework and a hands-on introduction to what's involved, whether it's adapting materials and teaching styles for the Web, or designing a virtual course. This book provides: + an introduction to the key educational concepts needed to adapt teaching methods and materials to the medium of the Internet + an introduction to both basic and advanced Internet skills--from using e-mail to collaborative conferencing + a framework for harnessing the Internet to achieve educational goals, and successfully exploiting its resources, features and applications to promote effective learning The framework starts from the premise that teachers should progressively apply Internet technology as their skills and confidence

develop. It develops the concept of "augmented" teaching styles-supplementing traditional teaching with Internet based options; demonstrates how to use modules as the building blocks for Web-based learning; and shows how to use the Internet to deliver individualized learning, by enhancing personal communication between teacher and student, and addressing the diversity of learning styles. The book abounds with inspiring and thought-provoking examples of Internet course materials developed by a wide variety of teachers and trainers, including modules and forms created by the authors who have extensive experience in delivering Internet-based courses. A glossary of terms and directory of Internet sites and resources complete the book, which is also supported by a related Web site.

Alcoholism is a uniquely human condition. Although some forms of alcohol dependence can be induced experimentally in a variety of laboratory animals, the complete spectrum of alcoholism with all of its physical, psychological, and social implications occurs only in man. The special quality of this relationship becomes more significant when one considers that the manifestations of most physical disease syndromes in animals and man are more similar than they are different. The uniqueness of alcoholism lies in the fact that it is one of the few physical diseases which reflects at all levels the problems of individuals coping with the complexities of human society. In

order to present a more coherent picture of these complex relationships, we have attempted to impose a logical sequence upon the material. This sequence lies along a dual parameter—from the physical to the social and from the theoretical to the empirical. Consequently, it was natural for the first volume in this series to deal with biochemistry, the most basic and physical aspect of the interaction of alcohol and man. It is equally natural for this, the second volume, to deal with physiology and behavior, for these levels of phenomenology—particularly the latter—are already more empirical and psychological in their manifestations. Finally, the third volume, clinical pathology, describes the disease itself, with all of the medical and social implications carried in the word "alcoholism.

This volume presents state-of-the-art empirical studies working in a paradigm that has become known as human behavioral ecology. The emergence of this approach in anthropology was marked by publication by Aldine in 1979 of an earlier collection of studies edited by Chagnon and Irons entitled *Evolutionary Biology and Human Social Behavior: An Anthropological Perspective*. During the two decades that have passed since then, this innovative approach

has matured and expanded into new areas that are explored here. The book opens with an introductory chapter by Chagnon and Irons tracing the origins of human behavioral ecology and its subsequent development. Subsequent chapters, written by both younger scholars and established researchers, cover a wide range of societies and topics organized into six sections. The first section includes two chapters that provide historical background on the development of human behavioral ecology and compare it to two complementary approaches in the study of evolution and human behavior, evolutionary psychology, and dual inheritance theory. The second section includes five studies of mating efforts in a variety of societies from South America and Africa. The third section covers parenting, with five studies on societies from Africa, Asia, and North America. The fourth section breaks somewhat with the tradition in human behavioral ecology by focusing on one particularly problematic issue, the demographic transition, using data from Europe, North America, and Asia. The fifth section includes studies of cooperation and helping behaviors, using data from societies in Micronesia and South America. The sixth and final section consists of a single chapter that places the volume in a broader critical and comparative context. The contributions to this volume demonstrate, with a high degree of theoretical and methodological sophistication--the maturity and freshness of this new paradigm in the study of human behavior. The volume will be of interest to anthropologists and other professions working on the study of cross-cultural human behavior.

Biology for grades 6 to 12 is designed to aid in the review and practice of biology topics such as matter and atoms, cells, classifying animals, genetics, plant and animal structures, human body systems, and ecological relationships. The book includes realistic diagrams and engaging activities to support practice in all areas of biology. The 100+ Series science books span grades 5 to 12. The activities in each book reinforce essential science skill practice in the areas of life science, physical science, and earth science. The books include engaging, grade-appropriate activities and clear thumbnail answer keys. Each book has 128 pages and 100 pages (or more) of reproducible content to help students review and reinforce essential skills in individual science topics. The series is aligned to current science standards.

Biology of Disease

Biology of Disease describes the biology of many of the human disorders and disease that are encountered in a clinical setting. It is designed for first and second year students in biomedical science programs and will also be a highly effective reference for health science professionals as well as being valuable to students beginning medical school. Real cases are used to illustrate the importance of biology in understanding the causes of diseases, as well as in diagnosis and therapy.

The view of nature as 'red in tooth and claw', as a jungle in which competition and predation are the predominant themes, has long been important in both the scientific and popular literature. However, in the past decade another view has become widespread among ecologists: the idea that mutualisms--mutually beneficial interactions between species--are just as important as competition and predation. This book is one of the first to explore this theme. Ideas and theories applicable to all sorts of mutualisms are presented and, where appropriate, examined in the light of concrete data. Themes explored include: the organisms involved, both animal and plant; how

specializations evolved once mutualisms formed; how mutualisms affect population dynamics and community structure; and the role of mutualisms in different environments. The book will be of special interest to ecologists and a wide range of biologists.

Written by a science journalist and teachers with over thirty years experience in the classroom, Biology Now skillfully blends core biology concepts with popular science stories of real people doing science today. These stories capture the human face of biology, highlighting the work of researchers and medical professionals who are making new discoveries every day. The text is accompanied by a wealth of carefully crafted pedagogy that teaches students how to analyze science in the news, interpret data, ask questions, and distinguish between science and pseudoscience.

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.
