"The world has become a global community which now provides more opportunities for collaboration, indeed, mandates it. The increased level of internationalisation of engineering education has placed Australian academic institutions in a new, and challenging situation. Therefore, the Conference general theme Internationalisation of Engineering Education was chosen to address this situation, and to discuss topical issues."--p. 5.

No algorithm, no "consensus statement," and no "standard of care" will help you now! You need intuitive type thinking, not analytical thinking. This book explores how to get it. Surgical Intuition offers a guided tour to becoming an expert, intuitive thinker. It is intended not only for general surgeons, but for family practitioners, primary care internists, and doctors of all specialties, as well as psychologists and cognitive scientists, because it shows that the possibilities and complexities of expert intuition are relevant to all fields of endeavor. The book sketches a full cognitive psychology theory of the thinking involved in expert surgery, and thus provides a description and an explanation of surgical intuition.

Anyone who requires detailed knowledge of the structures and functions of the human brain needs this self-test coloring book. It includes more than 350 illustrations that give a sharp and realistic view of the human brain and nervous system, examining its constituent parts and how they all work. The physical task of coloring in the illustrations makes an impression on your mind, allowing you to remember the shape, location, and purpose of each part of the brain. Pages lay flat for easy coloring, labels are left blank so you can test your knowledge as you color, and answers are located at the bottom of the page. After you're finished, visualizing these areas becomes much easier, leading to greater memorization and recall. Medical and healthcare students—as well as practitioners—will want to get their hands on this concise, interactive reference to the fascinating human brain.

The significantly expanded and updated new edition of a widely used text on reinforcement learning, one of the most active research areas in artificial intelligence. Reinforcement learning, one of the most active research areas in artificial intelligence, is a computational approach to learning whereby an agent tries to maximize the total amount of reward it receives while interacting with a complex, uncertain environment. In Reinforcement Learning, Richard Sutton and Andrew Barto provide a clear and simple account of the field's key ideas and algorithms. This second edition has been significantly expanded and updated, presenting new topics and updating coverage of other topics. Like the first edition, this second edition focuses on core online learning algorithms, with the more mathematical material set off in shaded boxes. Part I covers as much of reinforcement learning as possible without going beyond the tabular case for which exact solutions can be found. Many algorithms presented in this part are new to the second edition, including UCB, Expected Sarsa, and Double Learning. Part II extends these ideas to function approximation, with new sections on such topics as artificial neural networks and the Fourier basis, and offers expanded treatment of off-policy learning and policy-gradient methods. Part III has new chapters on reinforcement learning's relationships to psychology and neuroscience, as well as an updated case-studies chapter including AlphaGo and AlphaGo Zero, Atari game playing, and IBM Watson's wagering strategy. The final chapter discusses the future societal impacts of reinforcement learning.
