Measuring metabolic rates is central to important questions in many areas of scientific research. Unfortunately these measurements are anything but straightforward, and numerous pitfalls await the novice and even the experienced investigator. Measuring Metabolic Rates de-mystifies the field, explaining every common variation of metabolic rate measurement, from century-old manometric methods through ingenious syringe-based techniques, direct calorimetry, aquatic respirometry, stable-isotope metabolic measurement and every type of flow-through respirometry. Each variation is described in

enough detail to allow it to be applied in practice. Background information on different analyzer and equipment types allows users to choose the best instruments for their application. Spirometry equations - normally a topic of terror and confusion to researchers - are derived and described in enough detail to make their selection and use effortless. Vital topics such as manual and automated baselining, implementing multi-animal systems, and the correct analysis and presentation of metabolic data are covered in enough detail to turn a spirometry neophyte into a hardened metabolic warrior, ready to take on the task of publication in peer-reviewed journals.

Techniques in Protein Chemistry is based on the papers presented on the second annual meeting of the Protein Society in August 1988. The compendium contains the significant technical advances in protein chemistry. The book highlights topics that are of general interest and practical value to protein chemists. Emphasis is given to methods and applications in protein sequencing; applications of mass spectrometry and nuclear magnetic resonance technology; limitations of amino acid microanalysis; and high-performance liquid chromatography. The book will be a good reference for chemists and researchers in the field of protein chemistry.
