Prior to the development of a simple test called the Apgar score, many newborn babies missed receiving the urgent care they needed at birth. Dr. Virginia Apgar came up with the Apgar score to help these newborns by rating them in a number of different

health areas. The savior of countless young lives, Virginia Apgar is hailed as a legend, a trailblazer, and an inventor. Readers delve into the riveting story of a medical legend who inspired women doctors to succeed at a time when society did not value the contributions of women in the work force.

Most of us know that we can perform athletically at higher levels. We know we can be better. We notice that we seem to be stuck in patterns of similar mistakes. Many of us are on an endless search for changes in technique and technology, searching for the missing key ingredients to success. If we're paying close attention to how we train and compete, we notice that we sabotage and limit ourselves. We may also suspect that we unconsciously sabotage ourselves because we find ourselves doing things that we know are counterproductive, but can't seem to get out of our own way. We also can't usually figure out why we undercut our ability. The most significant challenges we usually face are the mental ones and not the physical ones. The key problem that many of us have is that we don't know how to stop sabotaging ourselves. Even if we recognize how we are sabotaging ourselves, we may not be able to stop. Intellectual knowledge is helpful, but it isn't sufficient to make deep and powerful changes. We've tried everything we know and it isn't enough. We need something deeper and more powerful. There's a deeper way of knowing and a deeper self-knowledge that we find when we develop a meditation practice.

We find our center where we are in touch with our deep wisdom and passion. When we live, train, and compete from our center, we find more clarity about our strengths and weaknesses. We learn that the barriers that appear to be holding us back are actually invitations to develop, change, improve, and tap into the deep strength that we find inside in order to follow through on what will help us more forward as athletes and people. This book of daily meditations for athletes has 366 meditations, one for each day of the calendar year. Each month has a different theme. Each meditation has some thoughts for your reflection and has a unique affirmation at the end, which you use for your meditation. You mindfully read the reflection and then meditate on the affirmation. You'll learn straightforward and powerful methods for meditating on the right things in the right ways. The Second Edition is simpler to use and more powerful to practice. It has an updated Introduction, including an assessment to help athletes figure out what parts of their mental game need work. A number of the meditations have been updated for clarity and simplicity. The affirmations are simpler, which makes meditation easier. There is now a chapter on confidence and a new chapter on being a powerful athlete. The meditation techniques in the Introduction and the Meditation Scripts chapter are updated. The sanctuary meditation technique is more integrated throughout the book. The language in the book is more conversational. The essence of a strong mental approach to high performance is the ability to manage our thinking, emotions, and physical states in order to perform at our highest levels. We learn to manage our thinking, emotions, and physical states

by practicing the right kinds of meditation. All athletes want to perform "in the zone" more than they do currently. Performing in the zone is a meditative state. To learn to perform in the zone more often, athletes can learn to meditate on the right things in the right ways. Now you can develop your mental game in as little as 15 minutes per day.

The versatile engine was used a prime mover to drive all kinds of machinery, working either from a fixed stationary position or as a portable- a trolley or truck was used to transport it to a location where an appliance needed power. They were available in all sizes, from diminutive models used for home-workshop tasks, to large-scale engines for driving agricultural or industrial machinery. David W. Edgington explores the many types and styles of old engine, describing their development from early steam and gas driven examples through to later versions fuelled by petrol, paraffin and diesel. Colour photographs and archive illustrations depict engines produced by well-known manufacturers such as the Associated Manufacturer's Company, Lister, Petter, and Wolseley, and those of lesser-known makers such as Morton and Naylor. This is the ideal introduction to these fascinating machines.

What happened at 10 Rillington Place was so shocking and gruesome that even today everyone over a certain age still remembers the case with a shudder. In 1950, Timothy Evans was hanged for the violent murder of his baby daughter; he was also assumed to have murdered his wife. Then, less than three years later, another tenant, John Christie, was found to have killed at least six women, hiding their bodies in the garden, under floorboards and in a concealed kitchen alcove. Christie followed Evans to the gallows. It seemed unlikely that two murderers were living at 10 Rillington Place, and the evidence that emerged in the Christie case eventually led to Evans receiving a pardon. But there was also circumstantial evidence that Evans had indeed killed his wife and child. Crime student Edna Gammon firmly

believes that Evans was guilty. In A House To Remember, she explains why.

Students often say, "I studied 40 hours for this exam and I still didn't do well. Where did I go wrong?" Most instructors hear this complaint every year. In many

cases, it is true that the student invested countless hours, only to produce abysmal results. Often, inefficient study habits are to blame. The important question is: why do so many students have difficulty preparing themselves for organic chemistry exams? There are certainly several factors at play here, but perhaps the most dominant factor is a fundamental disconnect between what students learn and the tasks expected of them. To address the disconnect in organic chemistry instruction, David Klein has developed a textbook that utilizes a skills-based approach to instruction. The textbook includes all of the concepts typically covered in an organic chemistry textbook, but special emphasis is placed on skills development to support these concepts. This emphasis upon skills development will provide students with a greater opportunity to develop proficiency in the key skills necessary to succeed in organic chemistry. As an example, resonance structures are used repeatedly throughout the course, and students must become masters of resonance structures early in the course. Therefore, a significant portion of chapter 1 is devoted to drawing resonance structures. Two chapters (6 and 12) are devoted almost entirely to skill development. Chapter 6 emphasizes skills that are necessary for drawing mechanisms, while chapter 12 prepares the student for proposing syntheses. In addition, each chapter contains numerous Skillbuilders, each of which is designed to foster a specific skill. Each skillbuilder contains three parts: 1. Learn the Skill: a solved problem that demonstrates a particular skill; 2. Practice the Skill: numerous problems (similar to the solved problem) that give the students an opportunity

to practice and master the skill; 3. Apply the Skill: one or two more-challenging problems in which the student must apply the skill in a slightly different environment. These problems include conceptual, cumulative, and applied problems that encourage students to think out of the box. Sometimes problems that foreshadow concepts introduced in later chapters are also included. All SkillBuilders are visually summarized at the end of each chapter (Skillbuilder review), followed by a list of suggested in-chapter and end-of-chapter practice problems. This text is an unbound, three hole punched version.

Throughout its previous four editions, Combustion has made a very complex subject both enjoyable and understandable to its student readers and a pleasure for instructors to teach. With its clearly articulated physical and chemical processes of flame combustion and smooth, logical transitions to engineering applications, this new edition continues that tradition. Greatly expanded end-of-chapter problem sets and new areas of combustion engineering applications make it even easier for students to grasp the significance of combustion to a wide range of engineering practice, from transportation to energy generation to environmental impacts. Combustion engineering is the study of rapid energy and mass transfer usually through the common physical phenomena of flame oxidation. It covers the physics and chemistry of this process and the engineering applications—including power generation in internal combustion automobile engines and gas turbine engines. Renewed concerns about energy efficiency and fuel costs, along with continued concerns over toxic and particulate emissions, make this a crucial area of engineering. New chapter on new combustion concepts and technologies, including discussion on nanotechnology as related to combustion, as well as microgravity combustion, microcombustion, and catalytic combustion—all interrelated and discussed by considering scaling issues (e.g., length and time scales) New information on sensitivity analysis of reaction mechanisms and generation and application of reduced mechanisms Expanded coverage of

turbulent reactive flows to better illustrate real-world applications Important new sections on stabilization of diffusion flames—for the first time, the concept of triple flames will be introduced and discussed in the context of diffusion flame stabilization
