When author Dave McMullan's wife XiangMin was pregnant with their youngest daughter, she was constantly followed around the streets of their hometown in China by a friendly little Dachshund. Growing fond of their newfound 4-legged friend, the McMullan family decided he deserved a name. His name became 'Banger' after the slang term for sausages in England. They were never sure if Banger had an owner or not, or whether they should take the little Dachshund into their home but as he looked happy and healthy enough, they decided not to. When their daughter Maya was born, Dave and XiangMin would often take her out to see Banger and he, as usual, was happy to see them. After a while Banger stopped coming around; Dave guessed that he had another family to make happy, and so he decided to write a poem for his cousin in London. This was how 'Banger the Sausage Dog - Lost in London' was born! Written in poetry form, 'Banger' is designed to introduce children to the joys of poetry as well as tell a tale of hard work, determination and success. Join Banger the Sausage Dog in an adventure that sees him winding his way to happiness on a foggy day in London town. As he navigates his way through the mist he finds himself in an increasing series of mishaps and adventures. On his travels, Banger struggles against adversity while looking for the joy that he deserves only to find it in the most unusual of places: a red London double-decker bus!

Recent publications in food engineering concern mainly food process engineering, which is related to chemical engineering, and deals primarily with unit operations and unit processes, as applied to the wide variety of food processing operations. Relatively less attention is paid to the design and operation of food processing equipment, which is necessary to carry out all of the food processes in the food plant. Significant technical advances on processing equipment have been made by the manufacturers, as evidenced by the efficient modern food processing plants. There is a need to relate advances in process engineering to process equipment, and vice versa. This book is an attempt to apply the established principles of transport phenomena and unit operations to the design, selection, and operation of food processing equipment. Since food processing equipment is still designed empirically, due to the complexity of the processes and the uncertainty of food properties, description of some typical industrial units is necessary to understand the operating characteristics. Approximate values and data are used for illustrative purposes, since there is an understandable lack of published industrial data.
