## The Gardeners' and Poultry Keepers' Guide and Illustrated Catalogue of Goods Manufactured and Supplied by W. Cooper, Ltd

A detailed Guide to Sustainable Decentralized Wastewater Systems Covering technical principles and practical applications, this comprehensive resource explains how to design and construct sound and sustainable decentralized wastewater systems of varying sizes and in differing geophysical conditions. Planning and Installing Sustainable Onsite Wastewater Systems covers state-of-the-art techniques, materials, and industry practices, and provides detailed explanations for why certain approaches result in more sustainable projects. A rational approach is presented for assessing assimilative capabilities of soils, and selecting methods of wastewater treatment and dispersal that make optimal use of natural treatment processes and site conditions. In-depth design and construction information highlights nonproprietary methods proven to be very sustainable and cost effective on a long-term basis for many geographic settings. Step-by-step illustrations and project examples featuring real-world implementations of onsite wastewater systems are included in this definitive volume. Planning and Installing Sustainable Wastewater Systems covers: Sustainability factors and planning considerations for decentralized wastewater systems Project planning and site evaluation Wastewater collection and conveyance methods Design and installation of primary treatment units Comparisons of secondary and advanced treatment

methods Sand filter construction Subsurface flow wetland performance and construction Effluent dispersal methods Design and installation of low-pressure dosed effluent dispersal systems

For generations, it has been an axiom that the purchase of a home is the greatest single investment the average person makes. The corollary has always been that if you take good care of that home it will inevitably be a good investment, permitting you to sell your home at a profit or allowing you to take out a large loan on the equity you've built up. While the axiom is still true, the corollary is no longer true. Many Americans have lost their homes due to the Great Recession and still more owe more on their homes than the homes are worth. People once made a lot of money on flipping homes; now many wonder if they should buy homes at all. There are unmistakable signs that we are headed into an even worse recession, making any housing decisions more important than ever. An acknowledged expert, Dr. Carol Roskey has spent a lifetime in studying all aspects of the housing field from financing to the best kinds of insulation. With her help, you can make well informed decisions.

Eighty-three million dogs and ninety-six million cats call the US home. Dogs alone produce enough waste to fill more than 1,127 football fields 10 feet deep in a single year. Add billions of plastic pick-up bags to the mix, and season well with tons of litter box waste. Scoop a hefty portion into local landfills and seal it tightly

to ensure optimal methane production. Clearly, this is a recipe for disaster. Dog and cat owners who trash their pets' offerings daily are in denial about how much waste is produced and what happens to it. Those who want to make the responsible choice often turn to the internet, only to find misleading, confusing, and contradictory information. The Pet Poo Pocket Guide will help you reduce your pet's environmental paw print with: Best practices for cycling pet waste back to nature Suggestions on how to tailor your approach based on location, situation, weather, needs or available time Instructions for using your composted pet waste safely to enrich your soil and nourish ornamental plants. With recycling tactics clearly indicated as "easy", "moderate", or "demanding", The Pet Poo Pocket Guide offers something for everyone. This no-nonsense guide is a must-read for any pet owner who is concerned about the environmental impact of their best friend, and is seeking a safe and practical solution.

The “marvelously funny” and much-loved humorist explores the perils of suburban living in this New York Times bestseller (Vogue). For years, the Bombecks have heard rumors of a magical land called Suburbia where the air is clean, the grass is trimmed, and children don't risk getting mugged on their walk to school. After watching their friends flee the city for subdivided utopias like Bonaparte's Retreat and Mortgage Mañana, Erma and her family load up their belongings and cry, “Station wagons . . . ho!” But life on the suburban frontier is not as perfect as they had hoped. The trees are stunted, the house is cramped, and there's no grass at all. But the Bombecks will make do, for they are suburbanites now—the last true pioneers! This ebook features an illustrated biography of Erma Bombeck including rare images and never-before-seen documents from the author's estate.

## **A Practical Guide to Winning Land Use Approvals and Permits**

Many lots in Weber County presently cannot be developed because adverse site characteristics (such as soil that percolates outside acceptable rate ranges or shallow ground water) make them unsuitable for conventional wastewater disposal systems (septic tank soil-absorption systems). The Weber-Morgan District Health Department and the Utah Division of Water Quality have developed designs for alternative wastewater disposal systems that may be used in such areas if hydrogeologic soil conditions are suitable, ground- and surface-water quality will not be degraded, and humans will not be exposed to wastewater pathogens. To demonstrate conformance with these criteria, hydrogeologic and soil studies of proposed sites will need to be conducted and results submitted to the Weber-Morgan District Health Department. Suitable hydrogeologic conditions include (1) site slopes no steeper than 4 percent, (2) soil percolation rates between 60 minutes/inch and 1 minute/inch (5 minutes/inch for both Ogden Canyon and Ogden Valley), (3) depth to seasonal shallow ground water at least 2 feet (0.6 m) below the bottom of soil-absorption drain-field trenches or beds and 1 foot (0.3 m) below the original ground surface (location of trenches and beds with respect to original ground surface varies with alternative system type), (4) depth to bedrock or unsuitable soil at least 4 feet (1.2 m) below the bottom of soil-absorption drain-field trenches, (5) topographic and geologic conditions that prevent wastewater from surfacing or reaching surface-water bodies or culinary wells within 250 days ground-water time of travel, (6) ground-water flow available for mixing in the zone of mixing in the aquifer below the site such that average nitrate concentrations will not be increased more than 1 mg/L under the anticipated wastewater loading, and (7) nitrate in high concentration zones (plumes) will not exceed 10 mg/L at any depth or location when it reaches the alternative wastewater disposal system owner's property line, as determined using a defensible solute transport model. Additionally, soil conditions should be such that wastewater will be adequately treated before reaching ground or surface water.
