This book gives an overview of the development of the evolution of language through a philosophical lens, and is a culmination of research combining visual communication, semiotic theory, cultural studies, linguistics, artificial intelligence and new media. It discusses the future of communication – through a pictographic framework – and the possibility of developing a standardized universal pictographic communication system that fosters mutual understanding and bridges diverse cultures. The research aims to locate the direction that research and development of a universal language for the posthuman era could take through the contextualization and realization of associated practice. Highly relevant in today's discussion about globalization, language and culture, the combination

The Earth

In SEARCH of the HISTORY of the AMAZONS. This book attempts to look at the phenomenon of Amazons from all sides, in order to shed more light on it and bring us close to its explanation. To fathom this legend, it is necessary first of all to refer to its earliest tradition that forms the foundation, without which the solution itself would be inconceivable. In the following, we look beyond the narrow confines of classic antiquity, to find where else in the world such Amazon-like myths exist. Our next step will be to moot different approaches to the question of Amazons. A central theme is the archeological research and our on-site investigation in those regions which are considered to have been the homelands of the Amazons, namely the land of the river Thermodon and Lemnos Island. According to this latest investigation, the lost history of the Amazons can be reconstructed.

Biomass burning profoundly affects atmospheric chemistry, the carbon cycle, and climate and may have done so for millions of years. Bringing together renowned experts from paleoecology, fire ecology, atmospheric chemistry, and organic chemistry, the volume elucidates the role of fire during global changes of the past and future. Topics covered include: the characterization of combustion products that occur in sediments, including char, soot/fly ash, and polycyclic aromatic hydrocarbons; the calibration of these constituents against atmospheric measurements from wildland and prescribed fire emissions; spatial and temporal patterns in combustion emissions at scales of individual burns to the globe.

Earth Resources

Since the publication of the last edition of this popular book, the world's political geography has changed dramatically. The refugee population has mushroomed. Migrations relocate millions every year. Onslaughts on tropical forests continue and overexploitation threatens maritime resources. This edition has been completely revised to reflect these transformations. The geography dimension has been strengthened through the expansion of material on Earth origins, crustal evolution and erosional processes. Increased attention is given to such topics as climate change, weather extremes, biogeography and resource questions. The second half has been recast, notably in the urban, economic and political chapters. The cartography is totally new and photographs are drawn from the author's field collection. This text includes full-color art and design and is organized into 30 brief eight-to-ten page chapters.
